

KSA Office IT Support & Infrastructure Management

Phase 07: IT Support Operations

Afaq Business Solutions Co.

Module 10: Service Availability Incident Report

1. Incident Summary

This report documents a service availability investigation involving an internal support service reported as unavailable. The investigation uses systemd status and journal logs, followed by controlled remediation and verification.

2. Ticket Details

- Ticket ID: HD017
- Department: IT Operations
- Reported By: Omar
- Priority: High
- Category: Service Availability

3. Reported Problem

The user reported that an internal support service was unavailable, and related functionality was not responding.

4. Investigation

- Identified an appropriate service for controlled investigation.
- Reviewed service status using `systemctl`.
- Reviewed recent service-specific logs using `journalctl`.
- Determined the service state from collected evidence.
- Avoid unrelated system configuration changes.

5. Remediation

If the selected authorized service required remediation, a controlled restart was performed using `systemctl`. The actual service name and observed result should be recorded from the lab execution.

6. Verification

- Rechecked service status after remediation.
- Reviewed recent service logs.
- Confirmed normal service operations were supported by the lab evidence.

7. Resolution

The service availability issue was addressed through controlled systemd troubleshooting and verification. The user was informed and the ticket was closed after successful verification.

8. Security Considerations

Only an authorized, non-critical or controlled service should be restarted. Screenshots and reports should not expose credentials, tokens, or unrelated sensitive system details.
