

KSA Office IT Support & Infrastructure Management

Phase 07: IT Support Operations

Afaq Business Solutions Co.

Module 08: Incident Report

1. Executive Summary

This report documents the investigation of an internal application incident in which report generation repeatedly failed because the report data source was unavailable.

2. Ticket Details

- Ticket ID: HD015
- Department: Accounts
- Reported By: Zain
- Priority: High
- Category: Log Analysis

3. Reported Problem

The user reported that the internal application intermittently failed when attempting to process an account report.

4. Investigation

- Verified the reported application issue.
- Reviewed the application log.
- Filtered ERROR entries.
- Reviewed surrounding entries for each error.
- Confirmed repeated report generation failures.
- Confirmed successful application startup.
- Confirmed that the report data source was unavailable during report generation.
- Identified the report data source as the likely cause.

5. Evidence Summary

The log showed successful application startup and report-module loading, followed by repeated report-data-source errors and corresponding report-generation failures. This sequence supports data-source availability as the likely cause.

6. Corrective Action

- Created a controlled, sanitized report configuration in the lab environment.
- Restored the required report-source configuration value.
- Avoid exposing credentials or real connection information.

7. Verification

- Verified the required report configuration values.
- Confirmed the configuration was available for the application workflow.

8. User Communication

The user was informed that the application issue had been investigated and the required configuration was restored.

9. Lessons Learned

- Application logs establish the sequence leading to an incident.
- Repeated errors and surrounding context support root-cause analysis.
- Configuration remediation should be controlled and verified.
- Sensitive configuration data must not be exposed to evidence.

10. Ticket Closure

The investigation and controlled remediation were completed, configuration was verified, and the ticket was marked resolved.
